CIALIS (Tadalafil): Treats Erectile Dysfunction, Symptoms Of Benign Prostatic Hyperplasia, And Pulmonary Arterial Hypertension

Synopsis

This item is a book, not the medical product. Although, your health condition may impact your everyday life, do not let it define who you are. • CIALIS (Tadalafil) is used to treat erectile dysfunction (ED, impotence; inability to get or keep an erection), and the symptoms of benign prostatic hyperplasia (BPH; an enlarged prostate) which include difficulty urinating (hesitation, dribbling, weak stream, and incomplete bladder emptying), painful urination, and urinary frequency and urgency in adult men. Tadalafil (Adcirca) is used to improve the ability to exercise in people with pulmonary arterial hypertension (PAH; high blood pressure in the vessels carrying blood to the lungs, causing shortness of breath, dizziness, and tiredness). Tadalafil is in a class of medications called phosphodiesterase (PDE) inhibitors. It works to treat erectile dysfunction by increasing blood flow to the penis during sexual stimulation. This increased blood flow can cause an erection. Tadalafil treats PAH by relaxing the blood vessels in the lungs to allow blood to flow more easily. Thanks and may you have a good understanding about this drug " CIALIS (Tadalafil). You may want to share this book with your family and friends who may be in need of help and would want to use this medicine. Take care, and as always, be well!
